About DEXA

Dual-energy X-ray absorptiometry (DEXA) is one of the popular machines for bone density checking since this is the most accurate way to measure bone mineral density (BMD). X-ray beams will be delivered from DEXA in different energy levels to the patient's spine or hip joints, and the system can compute the bone density of the patient by comparing the absorption rates of the two sets of transmissions.

This is the quick way for a test with very low doses of radiation. It allows patients to keep track of their bone density annually and it is particularly recommended for those aged above 45, including postmenopausal women, the elderly, and those with a family history of osteoporosis.

Welcome for enquiry about DEXA, our e-mail staff@bnsimaging.com
